

IN THE SPECIFICATION

Please amend the specification as follows:

In Paragraph 32:

[0032] In one embodiment, the geometric shape is represented as a three-dimensional electronic object, such as an octahedron (or diamond) depicted at 500 of FIG. 5.424. This example visual depiction is presented in FIG. 5 and is further discussed below. Connecting lines of the object represent visually each unique information quality metric. Any three connecting lines (three specific metric values) form a surface area that represents a unique capability. Moreover, for each specific metric value a unique information level of maturity is readily discernable. In some embodiments, for each set of three metric values and unique capability, a single unique level of maturity is readily discernable, at 123.

In Paragraph 47:

[0047] FIG. 3 depicts a block diagram representing an information modeling system 300. The modeling system 300 is implemented in a computer-accessible medium or media and processes on one or more computing devices interfaced over a network 315 with one another. The modeling system 300 includes an information modeling tool 310 and an interface 320. The system uses an information repository 330 and a remote service 340.
